# Climate change impacts on mountain regions of the world

## *Impacts du changement climatique sur les régions montagneuses à travers le monde*

The UNESCO  
Climate Change Platform

# **Les montagnes : des systèmes d'alerte précoce pour le changement climatique**

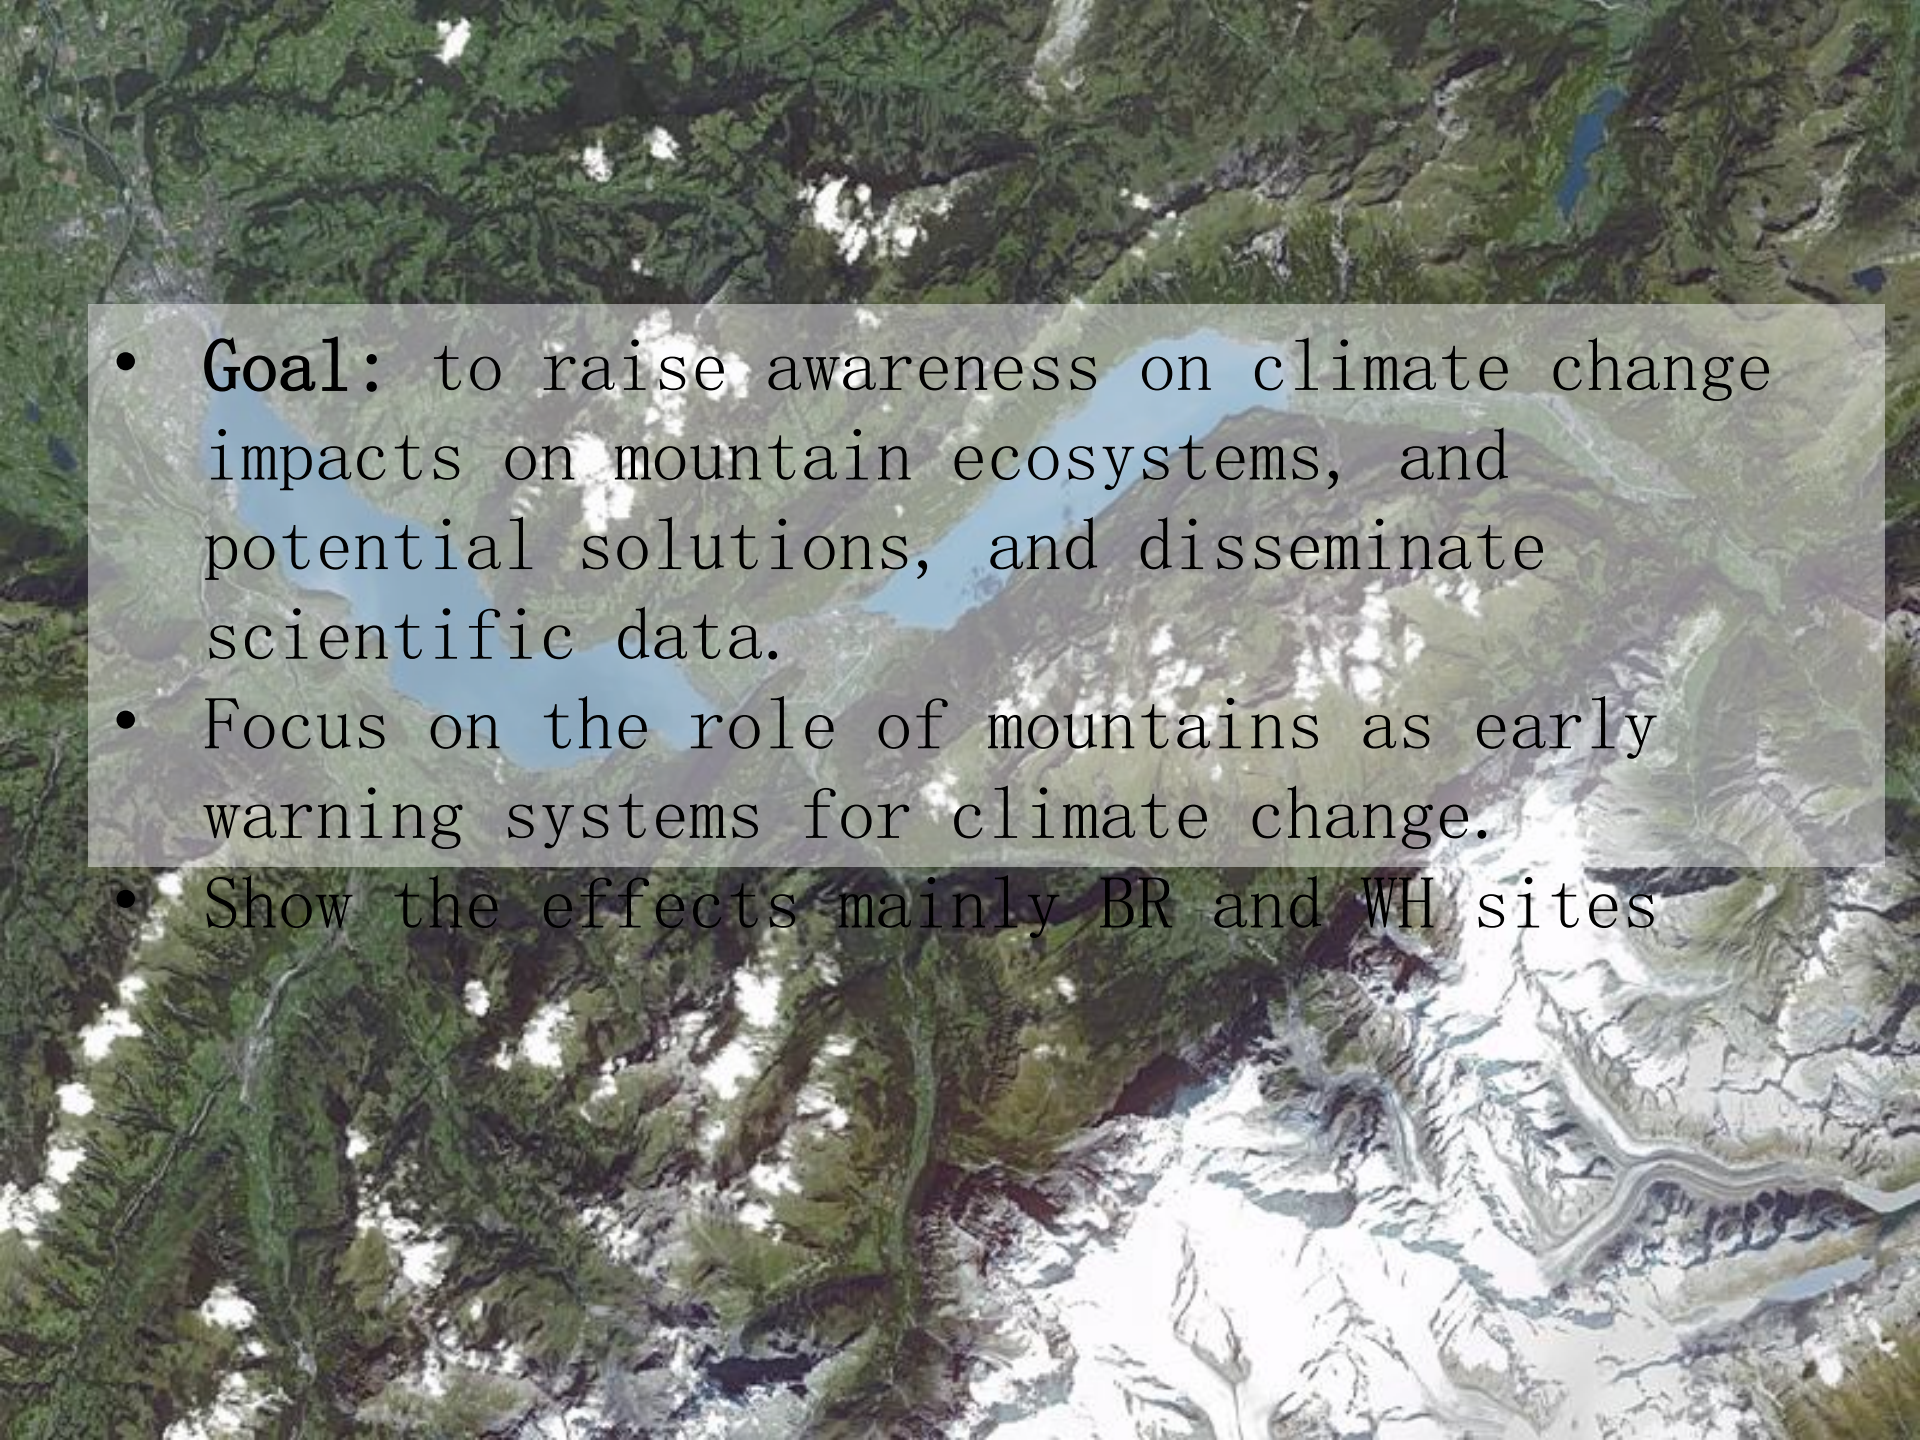

## ***Mountains: early warning systems for climate change***

- Government of Flanders, Belgium
- Japan Aerospace Exploration Agency (JAXA)
- European Space Agency (ESA)
- United States Geological Survey (USGS)
- World Glacier Monitoring Service (WGMS)
- GRID-Arendal and Wild Touch.

- 
- An aerial photograph of a mountainous region. The foreground and middle ground show steep, rocky slopes with patches of green vegetation and snow. A winding road or path is visible on the right side. A semi-transparent rectangular box is overlaid on the center of the image, containing a bulleted list. The background shows more distant, snow-covered mountain peaks under a clear sky.
- **Goal:** to raise awareness on climate change impacts on mountain ecosystems, and potential solutions, and disseminate scientific data.
  - Focus on the role of mountains as early warning systems for climate change.
  - Show the effects mainly BR and WH sites

# Why mountains?

- Occupy 25% of the Earth's surface.
- Home to about 1.2 billion people.
- Water towers of the world.
- Contain more than half of the world's biodiversity hotspots, much of which is used by people for food, fiber, timber, and medicine.
- Regulate the climate, purify the air, and store carbon dioxide.
- 59% of the WNBR contain mountain ecosystems.

A satellite image of a river delta, showing a complex network of channels and distributaries. The land is a mix of brown and tan colors, while the water is a light blue. The channels are highly branched and meandering, typical of a large river delta system.

Why did we use satellite imagery?

...Because an image  
worth a thousand words

Over the last 100 years about 85% of the Kilimanjaro's ice cover has disappeared. Glaciers shrank from an area of 11.40 km<sup>2</sup> in 1912 to only 1.76 km<sup>2</sup> in 2011.

Mount Everest: the total area covered by glaciers in the Dudh Koshi Basin declined by 143 km<sup>2</sup>, which is equivalent to 27% area loss between 1980

The Great Aletsch Glacier has retreated by about 3.4 km in length since the mid- 19th century, nearly half of which occurred during the past 56

# Nigardsbreen : Les fluctuations du glacier émissaire

## Nigardsbreen: Fluctuations of the maritime outlet glacier

Le Nigardsbreen est l'un des nombreux glaciers émissaires du Jostedalbreen (« breen » signifie glacier en norvégien). Situé dans le Parc National de Jostedal, près des côtes occidentales de la Norvège, le Jostedalbreen est une grande calotte glaciaire d'Europe continentale (474 km<sup>2</sup>).

Le Nigardsbreen a une superficie de 48 km<sup>2</sup>. Culminant à 350 m au-dessus du niveau de la mer, il est le glacier émissaire le moins élevé

du parc, ainsi qu'un des glaciers les plus accessibles au monde. Au cours des 50 dernières années, le glacier a oscillé entre périodes d'expansion et de recul.

Le Jostedalbreen, avec de nombreux autres glaciers norvégiens, contribue grandement à la production d'hydroélectricité : cette énergie compte pour 98 % de l'énergie produite en Norvège pour l'usage domestique et pour l'exportation. Environ 15 % du

ruissellement utilisé provient de bassins glaciaires dont les réserves sont principalement disponibles en été. Mais sa faible altitude rend le Nigardsbreen plus sensible aux variations de précipitations et donc plus sujet à la fonte que les glaciers situés à l'intérieur des terres. Le recul du glacier a pour conséquence une importante modification de la végétation dans les zones adjacentes.

*Nigardsbreen is one of several icy arms extending out from the Jostedalbreen ("breen" meaning glacier in Norwegian). Jostedalbreen lies in the Jostedal National Park near the western coast of Norway and is the largest ice cap on mainland Europe (474 km<sup>2</sup>).*

*Nigardsbreen has a surface area of 48 km<sup>2</sup>. At 350 m above sea level, it is also the lowest arm in the park and one of the most accessible*

*glaciers in the world. For the last 50 years, this glacier has experienced alternating periods of growth and loss.*

*Together with many other Norwegian glaciers, Jostedalbreen contributes significantly to hydropower, which accounts for 98% of the energy produced for Norway's domestic use and export. Around 15% of the run-off used for power generation comes from glaciated basins with most of the water being available during summer. But*

*because of its low altitude Nigardsbreen is more sensitive to changes in precipitation and thus to melting than glaciers situated further inland. This leads to significant vegetation changes in areas near the glaciers.*

FOR THE GOALS

# Next activities: UNESCO Chair on WH and BR Observation and Education

- Heidelberg University of Education, Germany
- Implement research/education projects
- Establish a capacity building programme for site managers to help monitoring through digital geo-media (remote sensing, GIS)
- Trainings for teachers and students

An aerial photograph of a rugged mountain range. The peaks are covered in snow, while the valleys and slopes are a mix of brown and green, indicating sparse vegetation. A prominent, winding river or stream flows through the center of the image, its path highlighted by the contrast between the dark water and the lighter, snow-covered terrain. The overall scene is one of natural beauty and geographical complexity.

Thank you!
